

NetScore Auction Management

For NetSuite

NetScore Auction Management application enables a powerful extension to your NetSuite platform, which enables customers to bid remotely by joining online auctions. NetScore Auction Management can be deployed as-is or customized further to meet your specific business requirements.

The built-in monitoring tool will keep the customer engaged with notifications of real-time auction statuses to all connected devices.

NetScore Auction Management is built on a flexible framework to make installation, setup and the activation process easier and faster. The solution can be easily maintained from the back-end with minimal steps required for administrators to start and end the auction for the product. All configurations are maintained through a central facility that is built into your NetSuite platform.

Benefits

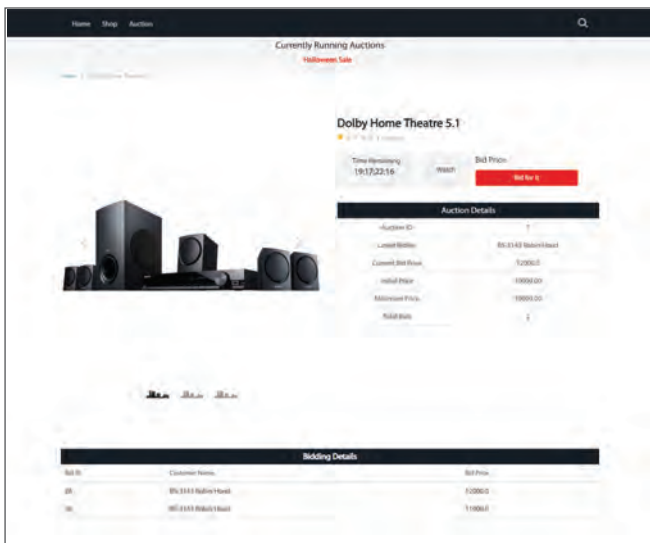

Realtime Auction Experience : Provides real time auction clock and a seamless bid synchronization with detail bidding history.

Fast Setup and Easy Maintenance : The auction configurator is easy enough to quickly setup an auction listing and publish to your website. Multiple categories of the auction can be created and run simultaneously.

Built for NetSuite : The auction engine runs native to NetSuite, helps to enable all leading practices to make the application compatible with NetSuite standards.

Increased Sales : Creates a competitive environment for customers, enticing them to place the highest bid to win.

Stock Clearance : Auctioning products online is the easiest way to sell the unsold inventory from your warehouses.

Features

Timer : A timer can be displayed in the product page for customers to know when an auction will end.

Bidders Table : A bidders table can be displayed in the product page, where customers can see all of the bidders and bid prices for that specific item in the auction.

Auction Details : A table can be displayed in the product page, where customers can see the auction details like latest bidder, auction name, latest bid price etc.

Watch : A watch button will be used for customers to know details about the auction. Current status, latest bidder, latest price can be viewed from the watch button as well as email notifications sent to the customer.

Configuration : The bidding process will be created in NetSuite backend where an administrator can enable and disable the auction feature for the product.

Bid : Customers have the ability to place multiple bids in a running auction.
